Обработка пропусков в данных, кодирование категориальных признаков, масштабирование данных.

Выбрать набор данных (датасет), содержащий категориальные признаки и пропуски в данных. Для выполнения следующих пунктов можно использовать несколько различных наборов данных (один для обработки пропусков, другой для категориальных признаков и т.д.)

Для выбранного датасета (датасетов) на основе материалов лекции решить следующие задачи: обработку пропусков в данных; кодирование категориальных признаков; масштабирование данных.

Выбор и загрузка данных

В качестве датасета будем использовать набор данных, содержащий данные по продажам автомобилей. А также его модифицированную версию, содержащую пропуски.

Набор данных имеет следующие атрибуты:

1) manufacturer - марка

2) model - модель

3) sales_in_thousands - продажи в тысячах

4) year_resale_value - годовой объем продаж

5) vehicle_type - тип автомобиля

6) price_in_thousands - цена в тысячах

7) engine_size - объем двигателя

8) horsepower - лошадиные силы

9) wheelbase - колесная база

10) width - ширина

11) length - длина

12) curb_weight - масса

13) fuel_capacity - топливный бак

14) fuel_efficiency - расход топлива

15) latest_Launch - начало производства модели

16) power_perf_factor - мощностной коэффициент

Импорт библиотек

```
import numpy as np
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
%matplotlib inline
sns.set(style="ticks")
```

Загрузка данных

```
data = pd.read_csv('C:\\Users\\Andrew\\Anaconda Projects\\datasets\\
car_sales.csv')
data_mod = pd.read_csv('C:\\Users\\Andrew\\Anaconda Projects\\
datasets\\car_sales_passes.csv')
```

Первичный анализ данных

Выведем первые 5 строк датасета:

```
data.head()
```

```
  Manufacturer    Model  Sales_in_thousands  __year_resale_value
Vehicle_type  \
0        Acura  Integra              16.919                16.360

3          91.389779
4          62.777639
```

Определим размер датасета:

```
data.shape
```

```
(157, 16)
```

В датасете 157 строк и 16 столбцов. Определим типы столбцов:

```
data.dtypes
```

```
Manufacturer            object
Model                   object
Sales_in_thousands     float64
__year_resale_value    float64
Vehicle_type            object
Price_in_thousands     float64
Engine_size            float64
Horsepower             float64
Wheelbase              float64
Width                  float64
Length                 float64
Curb_weight            float64
Fuel_capacity          float64
Fuel_efficiency        float64
Latest_Launch           object
Power_perf_factor      float64
dtype: object
```

Проверим наличие пропусков:

```
data.isnull().sum()
```

```
Manufacturer            0
Model                   0
Sales_in_thousands      0
__year_resale_value    36
Vehicle_type            0
```

```
Price_in_thousands      2
Engine_size             1
Horsepower              1
Wheelbase               1
Width                   1
Length                  1
Curb_weight             2
Fuel_capacity           1
Fuel_efficiency         3
Latest_Launch           0
Power_perf_factor       2
dtype: int64
```

Видим, что пропуски наблюдаются в некоторых столбцах.

Обработка пропусков данных

Удалим колонки, содержащие пустые значения:

```
data_new_1 = data.dropna(axis=1, how='any')
(data.shape, data_new_1.shape)
```

```
((157, 16), (157, 5))
```

Выведем первые строки датасета на экран:

```
data_new_1
```

```

Импьютация данных

Обработка пропусков в числовых данных

Выберем числовые столбцы с пропущенными значениями и посчитаем количество пустых значений:

```
num_cols = []
for col in data.columns:
    temp_null_count = data[data[col].isnull()].shape[0]
    dt = str(data[col].dtype)
    if temp_null_count>0 and (dt=='float64' or dt=='int64'):
        num_cols.append(col)
        temp_perc = round((temp_null_count / data.shape[0]) * 100.0,
2)
        print('Столбец {}. Тип данных {}. Количество пустых значений
{}, {}%.'.format(col, dt, temp_null_count, temp_perc))
```

```
Столбец __year_resale_value. Тип данных float64. Количество пустых
значений 36, 22.93%.
Столбец Price_in_thousands. Тип данных float64. Количество пустых
значений 2, 1.27%.
Столбец Engine_size. Тип данных float64. Количество пустых значений 1,
0.64%.
Столбец Horsepower. Тип данных float64. Количество пустых значений 1,
0.64%.
Столбец Wheelbase. Тип данных float64. Количество пустых значений 1,
0.64%.
Столбец Width. Тип данных float64. Количество пустых значений 1,
0.64%.
Столбец Length. Тип данных float64. Количество пустых значений 1,
0.64%.
Столбец Curb_weight. Тип данных float64. Количество пустых значений 2,
1.27%.
Столбец Fuel_capacity. Тип данных float64. Количество пустых значений
1, 0.64%.
Столбец Fuel_efficiency. Тип данных float64. Количество пустых
значений 3, 1.91%.
Столбец Power_perf_factor. Тип данных float64. Количество пустых
значений 2, 1.27%.
```

Отфильтруем по столбцам:

```
data_num = data[num_cols]
data_num
```

```
     __year_resale_value  Price_in_thousands  Engine_size  Horsepower

Будем использовать встроенные средства импьютации библиотеки scikit-learn

```
data_num_pit = data_num[['Price_in_thousands']]
```

```
from sklearn.impute import SimpleImputer
from sklearn.impute import MissingIndicator
```

Фильтр для проверки заполнения пустых значений:

```
indicator = MissingIndicator()
mask_missing_values_only = indicator.fit_transform(data_num_pit)
mask_missing_values_only
```

```

```

Проведем импьютацию различными показателями центра распределения:

```
strategies=['mean', 'median', 'most_frequent']
```

Создадим функцию, позволяющую задавать столбец и вид импьютации:

```
def test_num_impute_col(dataset, column, strategy_param):
    temp_data = dataset[[column]]

    indicator = MissingIndicator()
    mask_missing_values_only = indicator.fit_transform(temp_data)

    imp_num = SimpleImputer(strategy=strategy_param)
    data_num_imp = imp_num.fit_transform(temp_data)

    filled_data = data_num_imp[mask_missing_values_only]

    return column, strategy_param, filled_data.size, filled_data[0],
filled_data[filled_data.size-1]
```

Проверим работу функции по продажам автомобилей:

```
data[['__year_resale_value']].describe()
```

```
       __year_resale_value
count           121.000000
mean             18.072975
std              11.453384
min               5.160000
25%              11.260000
50%              14.180000
75%              19.875000
max              67.550000
```

```
test_num_impute_col(data, '__year_resale_value', strategies[0])
```

```
('__year_resale_value', 'mean', 36, 18.07297520661157,
18.07297520661157)
```

```
test_num_impute_col(data, '__year_resale_value', strategies[1])
```

```
('__year_resale_value', 'median', 36, 14.18, 14.18)
```

```
test_num_impute_col(data, '__year_resale_value', strategies[2])
```

```
('__year_resale_value', 'most_frequent', 36, 7.75, 7.75)
```

Обработка пропусков в категориальных данных

Проверим категориальный признак:

```
cat_cols = []
for col in data.columns:
    temp_null_count = data_mod[data_mod[col].isnull()].shape[0]
    dt = str(data_mod[col].dtype)
    if temp_null_count>0 and (dt=='object'):
        cat_cols.append(col)
        temp_perc = round((temp_null_count / data.shape[0]) * 100.0,
2)
        print('Столбец {}. Тип данных {}. Количество пустых значений
{}, {}%.'.format(col, dt, temp_null_count, temp_perc))
```

```
Столбец Manufacturer. Тип данных object. Количество пустых значений
15, 9.55%.
```

```
cat_temp_data = data_mod[['Manufacturer']]
cat_temp_data.head()
```

```
  Manufacturer
0        Acura
1        Acura
2        Acura
3        Acura
4         Audi
```

```
cat_temp_data['Manufacturer'].unique()
```

```
array(['Acura', 'Audi', 'BMW', 'Buick', 'Cadillac', 'Chevrolet', nan,
       'Dodge', 'Ford', 'Honda', 'Hyundai', 'Infiniti', 'Jaguar',
'Jeep',
       'Lexus', 'Mitsubishi', 'Mercury', 'Mercedes-B', 'Nissan',
       'Oldsmobile', 'Plymouth', 'Pontiac', 'Porsche', 'Saab',
'Subaru',
       'Toyota', 'Volkswagen', 'Volvo'], dtype=object)
```

```
cat_temp_data[cat_temp_data['Manufacturer'].isnull()].shape
```

```
(15, 1)
```

Импьютация наиболее частыми значениями:

```
imp2 = SimpleImputer(missing_values=np.nan, strategy='most_frequent')
data_imp2 = imp2.fit_transform(cat_temp_data)
data_imp2
```

```

Кодирование шкал порядка

Для кодирования шкал порядка воспользуемся функцией map:

```
sizes = ['small', 'medium', 'large', 'small', 'medium', 'large',
'small', 'medium', 'large']

pd_sizes = pd.DataFrame(data={'sizes':sizes})
pd_sizes
```

```
    sizes
0   small
1  medium
2   large
3   small
4  medium
5   large
6   small
7  medium
8   large
```

```
pd_sizes['sizes_codes'] = pd_sizes['sizes'].map({'small':1,
'medium':2, 'large':3})
pd_sizes
```

```
    sizes  sizes_codes
0   small            1
1  medium            2
2   large            3
3   small            1
4  medium            2
5   large            3
6   small            1
7  medium            2
8   large            3
```

```
pd_sizes['sizes_decoded'] = pd_sizes['sizes_codes'].map({1:'small',
2:'medium', 3:'large'})
pd_sizes
```

```
    sizes  sizes_codes sizes_decoded
0   small            1         small
1  medium            2        medium
2   large            3         large
3   small            1         small
4  medium            2        medium
5   large            3         large
6   small            1         small
7  medium            2        medium
8   large            3         large
```

Кодирование категорий наборами бинарных значений - one-hot encoding

Каждое уникальное значение признака становится новым отдельным признаком:

```
from sklearn.preprocessing import OneHotEncoder

ohe = OneHotEncoder()
cat_enc_ohe = ohe.fit_transform(cat_enc[['cat1']])
cat_enc_ohe
```

```
<157x27 sparse matrix of type '<class 'numpy.float64'>'
     with 157 stored elements in Compressed Sparse Row format>
```

```
cat_enc.shape
```

```
(157, 1)
```

```
cat_enc_ohe.shape
```

```
(157, 27)
```

```
cat_enc_ohe.todense()[0:10]
```

```

```

Масштабирование данных

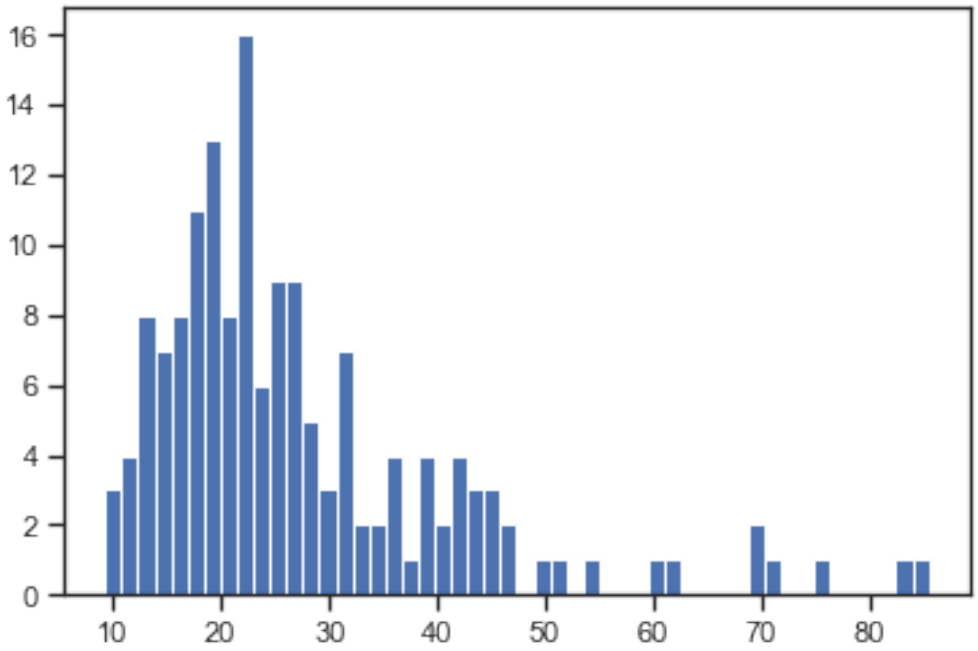
Масштабирование предполагает изменение диапазона измерения величины.

```
from sklearn.preprocessing import MinMaxScaler, StandardScaler,
Normalizer
```

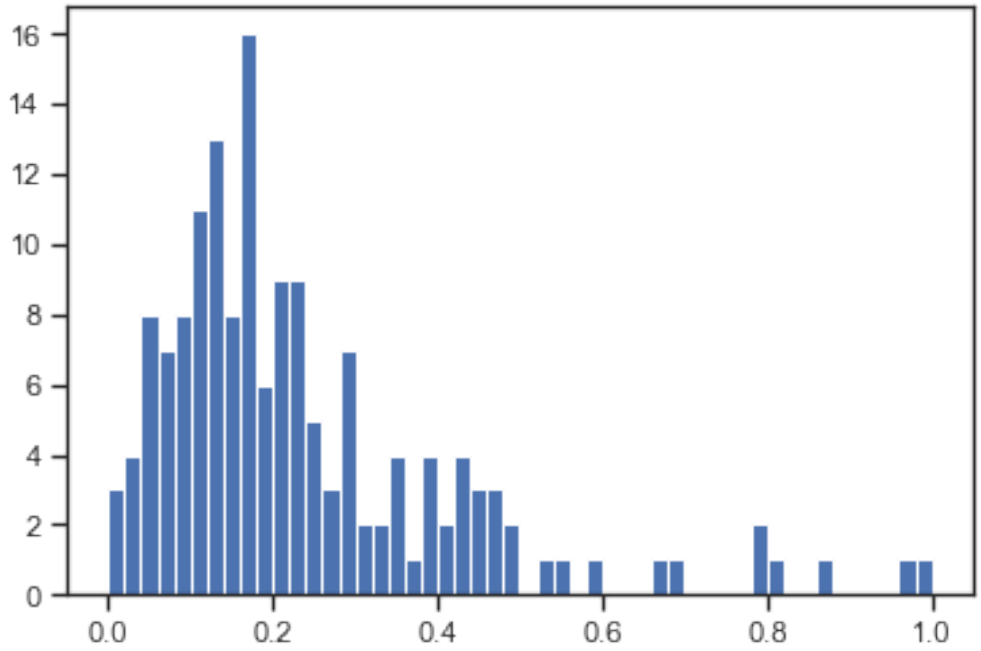
MinMax масштабирование

```
sc1 = MinMaxScaler()
sc1_data = sc1.fit_transform(data[['Price_in_thousands']])

plt.hist(data['Price_in_thousands'], 50)
plt.show()
```



```
plt.hist(sc1_data, 50)
plt.show()
```



Масштабирование данных на основе Z-оценки

```
sc2 = StandardScaler()
sc2_data = sc2.fit_transform(data[['Price_in_thousands']])

plt.hist(sc2_data, 50)
plt.show()
```
